

USER INTERFACE DESIGN

EXPERIMENT – 4

Topic: Familiar and Unfamiliar version

NAME: DHARSHINI G

ROLL NO: 240701121

I developed a prototype using Proto.io to incorporate both familiar and unfamiliar navigation elements in a Food Ordering Application. The aim of this experiment is to evaluate the ease of use among different user groups by comparing common navigation patterns with experimental navigation techniques.

The prototype consists of six screens: three screens for the familiar version (Home, Cart, Profile) and three screens for the unfamiliar version (Home, Cart, Profile).

Familiar and Unfamiliar Navigation in UI/UX Design

Familiar Navigation refers to design elements that users commonly see in mobile applications.

These are easy to understand and require no special learning.

Examples:

- Bottom navigation bar
- Cart icon

- Profile edit button
- Standard layout

Unfamiliar Navigation refers to new or less common interaction patterns that users may not immediately understand.

Examples:

- Swipe-based navigation
- Hidden gestures
- No visible navigation bar

Familiar Navigation Elements Used

- Bottom navigation bar (Home, Cart, Profile)
- Direct tap navigation
- Clearly visible cart button
- Edit profile option

Unfamiliar Navigation Elements Used

- Swipe left and right navigation
- No bottom navigation bar
- Gesture-based screen transition
- Hidden navigation style

User Testing

The prototype was tested with different users. Users were asked to:

1. Open Cart
2. Navigate to Profile
3. Return to Home

Observation:

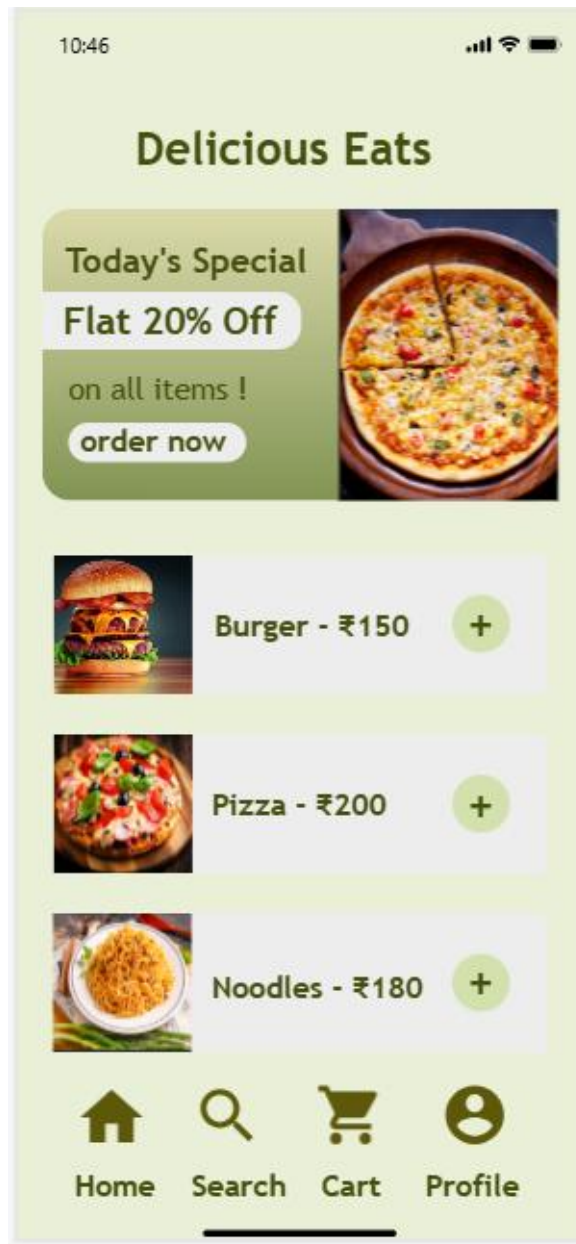

Most users completed tasks faster using the familiar bottom navigation. Some users found the swipe navigation slightly confusing initially.

Conclusion

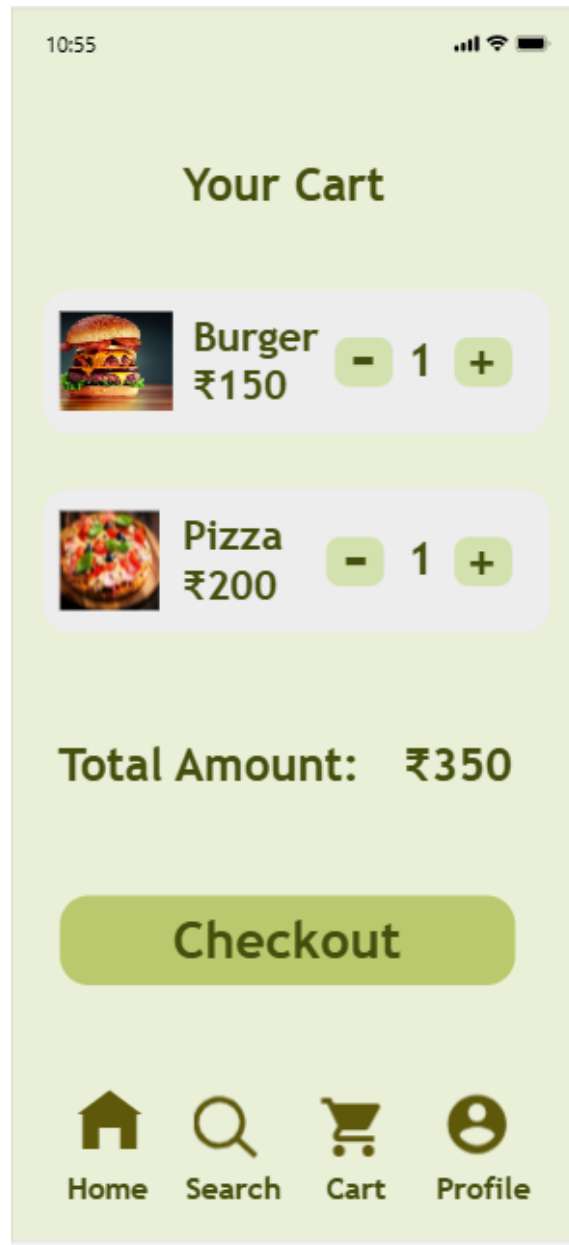

The familiar navigation was easier and more efficient for most users. The unfamiliar swipe-based navigation required more effort and learning. Therefore, familiar navigation patterns improve usability and user experience.
